Web Application

GitHub Link:

<https://zaamirrazi.github.io/TurtleTale/index.html>

The web application is set up with a clear hierarchy of HTML pages that make use of semantic tags for better search engine optimization (SEO) and accessibility. The use of tags like "header," "nav," "main," and "footer" makes sure that users and web crawlers can both readily grasp the web pages. This organized approach enhances user ease while enhancing indexing.

Because users may access the program on a number of devices, responsive design is a crucial part of current web development. The online application's design and content are modified using a mobile-first strategy for portable devices. Using CSS media queries, the design can readily expanded to fit bigger displays while preserving a unified and visually pleasant presentation across devices. Due to its responsiveness, the website is easy for people to access and utilize on any device.

Conclusion:

The creation of the Turtle Hatcheries web application brought a variety of difficulties that need teamwork and original problem-solving. Solving was one of the significant challenges. Despite these challenges, we managed to produce a web application that perfectly satisfies the project's requirements.

This project serves as an example of our web development skills in HTML, CSS, and JavaScript. It shows our capacity to create user-centered web applications while taking accessibility, responsive design, and performance optimization into account. By following best practices and employing cutting-edge digital technology, we have developed an engaging platform that successfully promotes turtle conservation in Sri Lanka.

Finally, both the general public and conservationists may gain from the Turtle Hatcheries Web Application.

One of the next upgrades and enhancements that will simplify things for consumers.
